SERVICES SOUND & VISION CORPORATION

For more information or to arrange a demo please email development@ssvc.com or call +44 (0) 20 3750 4300

- The MiPlayer is specifically designed to deliver media to remote locations where normal services are not possible either because of lack of connectivity, location or as a result of war or natural disaster. Alternatively it can complement services in more regular locations enabling better efficiency of a limited internet provision by reducing “boredom browsing”.
- It provides a user experience as close as possible to that experienced by users in areas with high speed broadband
- It can deliver existing broadcast services, as well as file based content. Broadcast content is live and also available as catchup for viewing/listening later.
- File content can include training and educational materials from life support to animal husbandry to reconstruction techniques
- Normal usage does not require users to install an app or plugin on modern devices with modern browsers.
- Available in different form factors to suit the intended installation environment.
- Integration is possible with existing WiFi networks, internet connections and other systems
- MiPlayer can broadcast TV and Radio services from any DVB broadcaster (subject to rights permissions)
- Already installed in military and civilian applications around the world.
